

Question: What should be in the “Dairy Trace Material”?

Answer: The following are currently being included as part of the Dairy trace mineral:

Zinc sulfate
Manganese sulfate
Selisseo .3%
Copper chloride
Iodine 9.2%
Cobalt carbonate

Question: Number of animals being fed/day?

Answer: The numbers fluctuate considerably. Current numbers are: Lactating Cattle - 6 head (typical range 20-35) and Dry Cattle – 70 head (typical range 50-100)

Question: What is the typical tonnage/load size expected for each delivery order under this contract?

Answer: Typical request is for the following but may vary (usually not more than 2 ton plus/minus):

*Cow Lactation Premix – 10 ton per order

*Dry Cattle Premix – 5 ton per order

Question: For the Dairy Trace Mineral, does USDA have an approved source/supplier, or should the contractor source this material commercially based on the components listed in the Q&A?

Answer: Contractor should source

Question: If the exact ingredient concentration is not commercially available for items such as Selenium 1600, Vitamin A, or Vitamin D3, would USDA allow an equivalent concentration/reformulation if the final ration meets the required formulation, or must the contractor quote strictly the listed ingredient concentrations with no deviation?

Answer: Equivalent would be allowed but must not constitute a significant change to ration from required formulation. Proposed changes may need to be approved by our contracted Dairy Nutritionist.
