

Solicitation questions and answers:

Q1: I am needing the detailed picking points that will be needed , can you provide this?

Q2: Any available picking / rigging documentation for the CV-22 to ensure accurate lift planning?

Q3: The PWS notes that additional information on the existing lifting eyes can be provided upon request. To ensure proper load chart verification and lift plan preparation, could you please provide:

- Rigging diagram or lifting point layout
- Distance between lifting eyes
- Center of gravity (if available)
- Any engineering drawings associated with the lift

ANSWER –

Distributing Technical Orders or Engineering Diagrams is not authorized; however, 58 MXS requires a 70T crane that has a boom that can extend at least 60ft, distance between lifting eyes (4 separate) is 3ft, Center of Gravity is directly below the lifting point on the canted deck.

The lifting points are above the canted deck on the Center Wing of the aircraft that are spaced 3ft apart (4 separate), it is directly above the Center of Gravity. We will use a sling provided by the 71st that connects to all lifting points, the hook latch should suffice to attach to the sling from the Crane (we have adapters if needed based on size of hook latch).
