JBPHH HI 96860-3134

IN REPLY REFER TO
J&A No. 25-015

**FACILITIES RELATED CONTROL SYSTEMS CLASS JUSTIFICATION AND APPROVAL
FOR USE OF OTHER THAN FULL AND OPEN COMPETITION**

1 Contracting Activity:

Department of the Navy, Naval Facilities Engineering Systems Command, Pacific (NAVFAC Pacific), Joint Base Pearl Harbor-Hickam, Hawaii.

2 Description of the Action Being Approved:

This Class Justification and Approval (CJ&A) authorizes and approves, on a brand-name basis, the use of Johnson Controls Incorporated (JCI) METASYS Building Automation System commercial equipment, for the Marine Corps' Defense Policy Review Initiative (DPRI) Program networked Direct Digital Control (DDC) system at Andersen Air Force Base (AAFB), Marine Corps Base Camp Blaz (MCBCB), and Naval Base Guam (NBG); which will not provide for full and open competition.

All JCI Metasys Building Automation Systems are authorized under this CJ&A regardless of method of execution or procurement strategy (i.e., contracted, in-house shop forces, base operating support contracts, or materials supply chain contractors).

The previous CJ&A No. 20-023 was approved by [REDACTED], on 1 July 2020 for the use of the Johnson Controls Incorporated (JCI) METASYS Building Automation System commercial equipment in contract actions requiring interface with the Area-Wide Energy Management System (AWEMS) at Andersen Air Force Base (AAFB), Marine Corps Base Camp Blaz (MCBCB), and Naval Base Guam (NBG) for the DPRI Program, which expires on 30 September 2025.

DPRI program is a bilateral program run by the Department of Defense and Japan's Ministry of Defense. NAVFAC Pacific's role is to execute the projects provided through the DPRI program. The DPRI Program from FY2020 to 2025 consisted of a total of 57 individual construction projects that would each require one (1) JCI METASYS Building Automation System. As of August 2025, 49 of those projects have been awarded. [REDACTED]

[REDACTED]

[REDACTED]

The current DPRI program is from [REDACTED] The authority to act under this current CJ&A expires on 30 September 2030.

3 Description Of Supplies/Services:

The use of JCI Metasys Building Automation System will be required for all projects that require a connection to the identified (existing or currently under development) installations networked Facilities Related Control Systems (FRCS), commonly referred to as the JCI Metasys Energy Management Control System (EMCS).

Building-level Programmable controllers are categorized as FRCS and include, but are not limited to, network controllers and routers, digital controllers, zone controllers, variable air volume controllers, unitary and equipment controllers, and expansion modules. Network-capable programmable digital controllers include, but are not limited to, network controllers and routers, building level supervisory controllers, zone controllers, variable air volume controllers, unitary and equipment controllers, and expansion modules. It does not include the physical system components (such as air handling units, chillers, boilers, condensing units, actuators, dampers, wiring, and similar). The JCI Metasys Building Automation System will be configured and programmed using Government-licensed software from JCI. This requirement does not restrict who can install, commission, test, maintain, or operate the controllers, and there are several known sources who can provide such services.

For the period FY2026 to 2031, a total of 18 individual construction projects are anticipated, each requiring one (1) JCI METASYS Building Automation System. The total estimated value for the 18 METASYS Building Automation Systems is [REDACTED]. A non-exhaustive listing of the projected projects that will utilize this equipment is provided in Appendix A. Appendix A identifies the requirements, quantities and costs for the projects that will be solicited in successive fiscal years as required by NMCARS 5206.303-1(d)(1).

Estimated Dollar Value of Brand Name Equipment

	FY2026-2031
Military Construction (MILCON)	[REDACTED]
Government of Japan (MAMIZU)	[REDACTED]
Total	[REDACTED]

4. Statutory Authority Permitting Other Than Full And Open Competition:

The statutory authority permitting other than full and open competition is Title 10 U.S.C. 3204(a)(1) and (b)(B)(i) and (ii), as implemented by the Federal Acquisition Regulation (FAR) 6.302-1, "Only one responsible source and no other supplies or services will satisfy agency requirements".

5. Rationale Justifying Use Of Cited Statutory Authority:

The Installations have a reasonable need for standardization and interoperability of its existing building control systems that will require a connection to the identified installation EMCS Network. Applicable United States Government Accountability Office (GAO) Comptroller General decisions have acknowledged the authority of a federal agency to use other than competitive procedures when there is a reasonable need for standardization or interoperability with existing agency equipment or software. GAO has concluded that the government may use other than competitive procedures when there is a reasonable need for standardization or interoperability with existing equipment or software, and when it is likely that award to other sources would result in substantial duplication of cost to the government that is not expected to be recovered through competition.

In accordance with NAVFACINST 11000.2 Facility Related Control System Standardization, to assess the need for standardization and interoperability, a rigorous Business Case Analysis (BCA) was performed on the existing inventory of building control systems connected to the EMCS Network. The BCA was signed by [REDACTED]. The BCA evaluated the standardization of building programmable controllers and quantified the annual costs associated with procurement, sustainment of operation and maintenance, and establishment and sustainment of Department of the Navy cybersecurity requirements. The results of the BCA demonstrate that in order to minimize costs and potential cyber vulnerabilities, the use of the METASYS Building Automation System will be required for all projects that require a connection to the EMCS Network.

Currently in AAFB, MCBCB, and NBG, there are 134 existing Programmable Building Controllers (PBC) which are JCI METASYS Building Automation Systems. This CJ&A identifies 18 new projects that will need to be completed by FY2031. With the added 18 projects, a total of 152 JCI PBCs will have been installed across AAFB, MCBCB, and NBG.

The following table shows the cost comparison between using JCI and other manufacturers:

	JCI	Other Manufacturer
Total Cost of Construction (TCC)	[REDACTED]	[REDACTED]
Total Estimated PBC Cost	[REDACTED]	[REDACTED]
# of PBC Required	18	18
PBC Unit Cost	[REDACTED]	[REDACTED]
Replace and Install 134 PBC	[REDACTED]	[REDACTED]
Install 18 PBC	[REDACTED]	[REDACTED]
Total Cost of PBC	[REDACTED]	[REDACTED]

[REDACTED]

[REDACTED]

Based on the current number of existing programmable building controllers that are JCI METASYS Building Automation System, it would not be cost-advantageous to the Government to consider another manufacturers product since the only way to maintain the existing security posture is to replace all existing JCI METASYS Building Automation with another manufacturer's product.

Additionally, in support of future Smart Grid program, all new building control systems, unless identified by exception, shall be required to connect to the EMCS Network.

The Installation requires that programmable controllers and front-end interfaces be the METASYS Building Automation System in order to meet its need for, and achieve the benefits of, standardization and interoperability as follows:

- a. Establish and maintain a defensible cybersecurity posture. The rapid emergence of cyber incidents on critical Industrial Control Systems (ICS), which include FRCS, with the potential to debilitate our installation mission critical assets has catalyzed the need to establish a defensive cybersecurity posture across the shore enterprise. A Risk Management Framework (RMF) Authority to Operate (ATO) is required per DoD Instruction 8510.01. The Installation's ATO status is the EMCS Network is actively pursuing ATO and has completed Step 3 of the RMF process as performed by NAVFAC.

The indicated manufacturer's programmable controllers and their associated application software will be authorized per the ATO and provide for the following:

- 1) Cost-effectively reduce government information technology cybersecurity risks. Avoid the significant costs and delays associated with obtaining a new ATO for the EMCS Network, due to government information technology cybersecurity risks, is required when additional nonconforming hardware or software is added to the system with resultant changes in the security posture of the system. The process of obtaining a new ATO would unacceptably delay the operational use of programmable controllers for the affected facility and connection of the facility to the EMCS Network, resulting in a significant degradation in accomplishment of mission.

Similarly, if additional non-conforming equipment and software were added to the

EMCS Network the associated cybersecurity costs to sustain the inventory of equipment and software and to maintain the ATO would significantly increase. Additionally, minimizing the different types of equipment and software permitted on the EMCS Network avoids incurring additional risks to system operational availability should the NAVFAC Functional Authorizing Official (FAO) determine that the additional equipment or software has security vulnerabilities precluding obtaining or maintaining an ATO.

- 2) Control Systems (such as networked FRCSSs) are classified as Platform Information Technology (PIT) systems. DoD Instruction 8500.01 requires that all PIT systems have their cybersecurity controls documented and validated prior to operation and/or deployment. All PIT systems on Navy networks must obtain an ATO from the FAO. Additionally, connection or integration into the Control Systems Platform Enclave (CSPE) and subsequently Smart Grid requires that the FRCSS obtain an ATO from the NAVFAC FAO.

ATOs remain valid for three years as long as the cybersecurity posture of the system does not change. A cybersecurity posture change includes, but is not limited to, system architecture changes or any other changes that increase risk or degrade the security posture. Any cybersecurity posture change must be provided to the Navy Validation Group that approved/authorized the ATO for impact review on that risk approval. When a cybersecurity posture changes, the PIT system normally will be required to complete the authorization process again to obtain a new ATO for the new configuration. The use of different brand programmable controllers or associated configuration or programming software on the EMCS Network results in an undesirable, higher number of changes to the cybersecurity posture of the system. Obtaining an ATO is not the end of the process; maintaining an ATO is also very resource intensive and the effort increases exponentially when additional hardware or software is added to the system (that is, requires maintaining cybersecurity controls, vulnerability management, system scans/tests, and similar).

- b. Be able to maximize utilization of existing government-licensed software from the existing manufacturers to configure and program the controllers. Other contractors do not offer programmable controllers that can be configured/programmed with the specified manufacturer software. Although the BACnet open protocol is the required communications protocol for all manufacturers' controllers, it only allows for different manufacturers' equipment to share basic point data. It does not allow for configuration and programming functions to take place between different manufacturers' controllers. For example, Manufacturer A's software cannot be used to program Manufacturer B's controller. Each manufacturer's proprietary software tools must be used to configure or change the program within a controller.
- c. Maintain installation networked facilities control and monitoring system so that all controllers can be programmed from a central station versus a hybrid system composed of many different controllers and associated configuration/programming software. This will further operational efficiency and decrease installation maintenance, repair, and

energy costs. Using hardware products from the same vendor that produced the configuration/programming software eliminates multi-vendor disputes regarding conflicts, standards, protocols, or performance characteristics should the controller not function as required.

- d. Avoid the significant operational burden and cost of having maintenance and engineering staff become proficient with the configuration, programming, commissioning, operation, and maintenance of controllers from different manufacturers. Standardization reduces personnel training costs and decreases procurement costs related to additional equipment, maintenance, and support contracts for another manufacturer's hardware and software, as well as the maintenance of an additional parts inventory. Maintaining multiple solutions is inefficient and creates unnecessary work and overhead that increases the total costs of ownership and manpower costs.

NAVFAC Pacific technical personnel who performed this BCA have determined that for the Installations, the contract actions authorized by this CJ&A will avoid substantial duplication of cost that is not expected to be recovered through competition. Assuming other brand name controllers could be integrated into the installation's EMCS Network so as to be fully functional, the significant cyber security risks, operational challenges, added costs (including the costs to re-procure the Installation's existing inventory), and other disadvantages arising from the use of different brands of controllers outlined above are not expected to be recovered through competition.

6. Description of Efforts Made to Solicit Offers from as Many Offerors as Practicable:

On 19 February 2025, an announcement was issued on the System for Award Management (SAM) website, in accordance with DFARS 206.302-1 to identify other potential responsible source of supply that can provide a DDC that has equal performance and listing/approval requirements compatible to the JCI METASYS Building Automation System. The announcement closed on 5 March 2025 – two responses were received:

- [REDACTED]:
[REDACTED] did not meet the technical requirements/salient characteristics requested. The equipment described by [REDACTED] “uses the Niagara framework for the programming language and they have the drivers available for operating and using the JCI software”. [REDACTED] however did not provide detailed technical data in order for the Government to conduct a comprehensive evaluation of the product to ensure full compatibility and interoperability with JCI, as required by the announcement.
- [REDACTED]:
[REDACTED] responded that they were an interested vendor. The firm stated that they were working on the requested information and would share it with the Government soon. No further responses were received.

The Project Manager and Contracting Officer that reviewed the announcement responses above determined that the submission did not meet the salient characteristics specified by the sources sought notice.

Therefore, there are currently no other responsible sources of supply, other than JCI, that can meet the Government's requirements.

7. Determination of Fair and Reasonable Cost:

The Contracting Officer has determined the anticipated cost to the Government of the supplies/services covered by this CJ&A will be fair and reasonable. The cost associated with a complete replacement is not practicable or cost effective.

8. Actions to Remove Barriers to Future Competition:

There will be no barriers to competition to evaluate the use of full and open competition for acquiring the same or similar supplies in the future. Market research will be conducted for future projects to ascertain the availability of new technology that may provide for other sources to meet the government's needs. The government will consider, as applicable, should any other potential sources of supply for a compatible product be submitted during the source selection process.

Since the previous CJ&A was approved, NAVFAC Pacific monitored the industry through a sources sought market analysis in February 2025. As indicated in paragraph 6, the market does not contain any other sources of supply for the Government's PBC requirement.

CERTIFICATIONS AND APPROVAL

TECHNICAL/REQUIREMENTS CERTIFICATION

I certify that the facts and representations under my cognizance which are included in this Justification and its supporting acquisition planning documents, except as noted herein are complete and accurate to the best of my knowledge and belief.

Technical/Requirements Cognizance:

[REDACTED] [REDACTED] [REDACTED] [REDACTED] [REDACTED]
[REDACTED] [REDACTED] [REDACTED] [REDACTED]

LEGAL SUFFICIENCY REVIEW

I have determined this Justification is legally sufficient.

[REDACTED] [REDACTED] [REDACTED] [REDACTED] [REDACTED]
[REDACTED] [REDACTED] [REDACTED] [REDACTED]

CONTRACTING OFFICER CERTIFICATION

I certify that this Justification is accurate and complete to the best of my knowledge and belief.

[REDACTED] [REDACTED] [REDACTED] [REDACTED] [REDACTED]
[REDACTED] [REDACTED] [REDACTED] [REDACTED]

ASSISTANT COMMANDER FOR CONTRACTING APPROVAL

Upon the basis of the above Justification, I hereby approve the solicitation of the proposed procurement(s) described herein using other than full and open competition, pursuant to the authority of 10 U.S.C. 3204(a)(1) and (b)(B)(i) and (ii), Only one responsible source and no other supplies or services will satisfy agency requirements.
